

### Shoe Scanner - complete solution for homeland security and loss prevention

Today's security solutions are missing a critical step when it comes to weapons detection and loss prevention. Traditional metal detectors and security screening devices stop short of detecting metals in shoes or on the ankles and feet. This creates a major security gap everywhere from airports and stadiums, to retail shops and jewelry stores.

Following the tragic attacks of September 11 and subsequent shoe bomber incident, Eurologix Security recognised an urgent need to address this void. The current "workaround" of removing shoes before passing through metal detectors is cumbersome, inconvenient and worst of all, inaccurate – creating long delays, discomfort and frustration, without fully allaying security concerns.

Working closely with the UK Government, Eurologix Security developed a patented technology to change security...from the bottom up. Our flagship solution, Shoe Scanner, offers a convenient step-in device that extends security screening and metal detection to include the ankles and feet, without requiring shoe removal.

Whether you're ensuring the safety of employees or customers, passengers or partygoers, Shoe scanner is ideal for use by:

- Airport Security
- Seaports
- Border Crossings
- Train Stations
- Corporate Offices
- Private Security/ VIP Services
- Government Agencies
- Courthouses
- Prisons
- Schools/Universities
- Stadiums
- Nightclubs
- Manufacturing Facilities
- Logistics Centers/ Warehouses
